Macro Cheat Sheet

Set your targets in 3 steps — no subscription required

1 • Find your calories

Estimate maintenance calories (bodyweight lb \times 14–16 for most people).

To lose fat: subtract 300–500/day. To gain: add 250–500/day.

2 • Set protein first

Aim for 0.7–1.0 g protein per lb of bodyweight — it keeps you full and protects muscle. Protein = 4 cal/g.

3 • Split the rest (carbs + fat)

Fat: 0.3–0.4 g per lb (min for hormones). Fat = 9 cal/g.

Carbs: fill the remaining calories. Carbs = 4 cal/g.

Hand-portion guide (no scale needed)

Protein = 1 palm · Carbs = 1 cupped hand · Fat = 1 thumb

Veggies = 1 fist. Roughly 1–2 of each per meal is a solid default.
